Abstract. The abstract should briefly summarize the contents of the paper in 150–250 words. It should be set in 9-point font size and should be inset 1.0 cm from the right and left margins. There should be two blank lines before and after the abstract. This document is in the required format.

Keywords: First keyword · Second keyword · Another keyword.

1 First Section

Summing up the results of the evaluation, we present our conclusions in Table 1. Fig. 1 shows a high-level overview.

Fig. 1. System architecture overview.

Table 1. Comparison of results across methods.

Method	Precision	Recall	F1
Baseline	0.712	0.698	0.705
Our Method	0.891	0.876	0.883
Oracle	0.952	0.947	0.949

1.1 A Subsection

The text continues here. Here we show a display equation:

$$\mathcal{L}(\theta) = -\frac{1}{N} \sum_{i=1}^N [y_i \log p_i + (1 - y_i) \log(1 - p_i)] \quad (1)$$

where $p_i = \sigma(\theta^\top x_i)$ is the predicted probability and y_i is the ground truth label.

Implementation Details. Our implementation uses the following hyperparameters:

- Learning rate: $\eta = 10^{-3}$
- Batch size: $B = 64$
- Training epochs: $T = 100$
- Dropout rate: $p_d = 0.1$

2 Related Work

Prior work [1] has explored deep learning approaches. Our method extends this with an improved attention mechanism [2].

Listing 1.1. Training loop

```
for epoch in range(num_epochs):
    for batch in dataloader:
        optimizer.zero_grad()
        loss = criterion(model(batch.x), batch.y)
        loss.backward()
        optimizer.step()
```

3 Conclusions

We have proposed a novel approach for the given task and demonstrated state-of-the-art results on standard benchmarks.

Acknowledgements. We thank the anonymous reviewers for their valuable feedback.
